An internal combustion engine is a heat engine where the combustion of a fuel occurs with an oxidizer in a combustion chamber that is an integral part of the working fluid flow circuit. In an internal combustion engine, the expansion of the high-temperature and high-pressure gases produced by combustion applies direct force to some component of the engine. The force is applied typically to pistons, turbine blades, rotor or a nozzle. This force moves the component over a distance, transforming ch

Internal Combustion Engine - Introduction and Types ...

Introduction to internal combustion engine. The chemical energy of the fuel is firstly converted into heat through combustion, and then the heat is converted into mechanical work by means of a working medium. This working medium can be a liquid or a gas. Indeed, the heat produced by combustion increases its pressure or its specific volume,...

Introduction to Internal Combustion Engine (Lecture 1)

In an internal combustion engine, the combustion of the fuel takes place within a combustion chamber in the presence of a suitable oxidiser (air, most often). The resultant rise in temperature and pressure from the combustion causes the movement of a specific part of the engine, the piston for example.
